the book principles of artificial lift explains the basics and fundamentals as well as the recent technology advancements in the field of artificial lift of producing oil and gas wells this book is written primarily for production engineers and petroleum engineering college students of senior level as well as graduate level although the purpose of this book is to help as well as teaching artificial lift it is supposed to be useful as a reference book to the engineers performing artificial application in petroleum industries we recognize that the topic of principle of artificial lift is not complete without a basic understanding of the concept regarding well inflow performance and multiphase flow in pipes this inflow performance is being elaborated in easiest manner at very beginning of the book regarding presentation this book focuses on presenting and illustrating engineering principles used for designing and analyzing well bore lifting systems rather than in depth reservoir engineering theories since the material of this book is virtually boundless in depth knowing what to omit was greatest difficulty with its editing many of the industry known basic formula are used instead of deriving the same

an improved version of woodward s chord plane aerodynamic panel method for subsonic and supersonic flow is developed for cambered wings exhibiting edge separated vortex flow including those with leading edge vortex flaps the exact relation between leading edge thrust and suction force in potential flow is derived instead of assuming the rotated suction force to be normal to wing surface at the leading edge new orientation for the rotated suction force is determined through consideration of the momentum principle the supersonic suction analogy method is improved by using an effective angle of attack defined through a semi empirical method comparisons of predicted results with available data in subsonic and supersonic flow are presented

this thesis develops a method for optimal planform design of wings and wing tail configurations that improves the designs using nonlinear optimization while accounting for induced profile and compressibility drag bending and buckling weight section maximum lift constraints and static aeroelasticity
